

RAM KAUSHAL GURRALA

☎ +91-8121212816 ✉ ramkaushalguralla@gmail.com 🔗 www.linkedin.com/in/ram-kaushal-5b7121139/

PROFESSIONAL SUMMARY

An experienced Data Scientist, with 4 years experience in advanced retail analytics, crafting scalable solutions for Fortune 100 companies. Proficient in machine learning, logistics optimization, supply chain management and demand forecasting. Expert in data visualization and stakeholder management, adept at fostering cross-functional collaboration and achieving impactful outcomes

EDUCATION

GITAM Institute of Science and Technology, Vishakapatnam

Jul 2017 – Jun 2021

Bachelor of Technology, Computer Science Engineering

GPA: 8.4/10

SKILLS

- **Technical Skills:** SQL, Python, Machine learning, Deep learning, AgenticAI, GenAI
- **Tools:** Snowflake, Tableau, Airflow, AWS Sagemaker, Streamlit, Github, AWS Bedrock, LangChain, LangGraph

PROFESSIONAL EXPERIENCE

Consultant at Ernst and Young (EY)

Sep 2024– Present

Fortune 100 Multinational Bank

Bangalore, India

- Designed and implemented an Agentic AI solution to automate and improve short-term forecasting accuracy using LangGraph-based orchestration.
- Reimagined and replaced the manual forecasting workflow with a modular, multi-agent system for enhanced scalability and adaptability
- Integrated external signals such as IVR downtime and real-time news using LangChain tools to enrich forecasts and detect short-term anomalies effectively
- Streamlined data ingestion, enrichment, and prediction through an agent-based pipeline, reducing manual intervention and latency.

Decision Scientist at Mu Sigma Business Solutions

Jul 2021– Sep 2024

Fortune 100 Footwear and Apparel Company

Bangalore, India

- Worked with the Supply Chain Advanced Analytics team of a Fortune 100 footwear and apparel company
- Responsible for the continuous development of a replenishment model using machine learning techniques to optimize the flow from distribution centers to regional service centers
- Developed valuable enhancements to the demand forecasting framework, introduced Clearance and Promotional elements to the program, and helped set up a disposition channel to clear up built-up inventory
- Improved the replenishment model by creating a simulation framework with Streamlit as the front-end, allowing stakeholders to simulate and understand the final stock transfer number before running the production pipeline
- Tech requirements include querying SQL on Snowflake, demand forecasting using Machine learning, writing python scripts (pandas, numpy, sklearn), deploying code to Airflow, maintaining DAGs, and creating performance reporting workbooks in Tableau

Fortune 100 pharmaceutical company

Bangalore, India

- Worked with the Data Science and analytics team of a Fortune 100 pharmaceutical giant to create a anomaly detection framework
- The project aimed to create a framework using machine learning techniques to flag hospitals that generate artificial data points and claim money for clinical trials
- Responsibilities include analyzing various patient and clinical trials studies, feature engineering, building ML models, creating reusable python notebooks, and more.
- Developed a streamlit app where stakeholders can upload a clinical trials dataset, and the backend script runs ML models to flag hospitals that generate artificial data points
- Built a machine learning model using IQR, Isolation Forest, and variance analysis, DB scan which increased the model's accuracy in finding anomalous data points

KEY ACCOMPLISHMENTS

Agentic AI framework for forecasting | Short term forecasting

- Developed an agentic AI framework that enabled the repurposing of approximately **40 FTEs** and **scaled to support nearly 100 distinct business groups**.

Streamlit app for Anomaly site flagging | Anomaly detection

- Developed a dashboard enabling clinical trial data upload and anomalous site identification, reducing manual checks and **saved around 3 million USD** in investigator costs

Simulation framework for the replenishment | Replenishment optimization

- Developed a simulation app that determined optimal fulfillment scenarios, contributing to a record-breaking **40 percent increase** in fulfillment during Black Friday sales and generating **15 million USD in EBITDA**

Generative AI application | Amazon web services(AWS) Hackathon

- Won the AWS Hackathon by creating an application that converts natural language text into SQL queries, generates outputs from a database, and uses LLMs from AWS bedrock to derive insights from the results
